Background Information

BAK1, also named as BAK, BCL2L7 and CDN1, belongs to the Bcl-2 family. In the presence of an appropriate stimulus, BAK1 accelerates programmed cell death by binding to, and antagonizing the anti-apoptotic action of BCL2 or its adenovirus homolog E1B 19k protein. Low micromolar levels of zinc ions inhibit the promotion of apoptosis. (PMID:17157251) BAK1 gene product primarily enhances apoptotic cell death following an appropriate stimulus. It can inhibit cell death in an Epstein-Barr virus-transformed cell line.
