Background

PPIF, also named as CYP3, PPIase F and Rotamase F, belongs to the cyclophilin-type PPIase family. PPIases accelerate the folding of proteins. It catalyzes the cis-trans isomerization of proline imidic peptide bonds in oligopeptides. PPIF is a mitochondrial matrix protein involved in the induction of necrotic and apoptotic cell death through the activation of the mitochondrial permeability transition (mPT) pore. Primary antibody in this kit is immunized with full length gene PPIF and absorbed by PPIA. So this kit is specific to PPIF.

Synonyms

Cyclophilin F, Cyp D, CYP3, peptidylprolyl isomerase F, PPIase F, PPIF, PPIF-Specific, Rotamase F
